Almost 20 years developing software solutions for a diverse set of industries, making technology usable for the people who have to work with it. From predictive quality control systems deployed at food processing plants in Argentina, where I trained the operators who operated them, through internal tooling and integrations at a global medical technology company, where Finance, HR and IT teams have been my effective clients. Currently also trying out AI adoption tools and automated web development pipelines.

At Brainlab I currently own cross-department projects end-to-end: from requirements and stakeholder alignment through vendor coordination, development, production rollout and continued support. Alongside that, I lead the company's Power Platform and SharePoint adoption programme, designing and delivering training sessions for non-technical colleagues, taking over complex projects within our department, and enabling citizen developers for minor tasks. In charge of apprentices going through our department, coaching them on best practices, architectural patterns and giving them structured feedback. The team leading aspect is the direction I want to grow into professionally.

On the technical side: I've built integrations connecting SAP, SharePoint, Salesforce and third-party providers via REST API, deployed enterprise identity and provisioning through Azure AD and SSO, including the full expenses management. Since February 2026, I've also been building my own SaaS platform on my free time, both with AI as an accelerator for development, but also as a provided service within the platform. Sole developer from concept to working product in under four months; AI enabled development really boosts projects, when used correctly.

I'm really curious about the projects you work with, how different companies apply solutions to their problems, and how you improve their results. I'd be glad to discuss how my background fits what the team needs.

Kind regards,

Nicolás Christie
