Teamleiter Softwareentwicklung · München (m/w/d)

Two apprentices go through my team at Brainlab each cycle. The technical mentoring is the easy part. What takes real attention is the personal side: setting expectations, structuring feedback, building someone's confidence to work independently rather than checking in on every ticket. Brainlab builds software for surgery and radiation therapy, so for almost six years the tools I've shipped have had to hold up in operating rooms and treatment planning, not just pass a demo. Software for ambulant and day-care providers carries a similar kind of weight: get it wrong and it's a nurse's workflow, not just a dashboard.

At Brainlab I own cross-department initiatives end to end, from requirements and stakeholder alignment through architecture, vendor coordination, delivery and production support, treating internal teams as clients rather than tickets in a queue. I contribute directly to internal IT strategy: which platforms we standardise on, where a custom integration is worth building over buying, how a solution should be architected before the first line of code. Leading the two apprentices, coaching them through architecture decisions, code reviews and our agile workflow, has been my first real leadership responsibility, technical and disciplinary both, and it's the direction I want to grow into full time.

.NET and REST APIs are the backbone of what I build: a custom ESB connecting SAP, SharePoint and Salesforce, third-party integrations via REST, and an OCR-plus-LLM pipeline for structured data extraction that runs fully self-contained with no external data exposure. On the frontend I work in HTML5, CSS, JavaScript, TypeScript and React, plus low-code delivery through the Power Platform for teams that need results faster than a full development cycle allows. Since February 2026 I've also been building my own SaaS platform solo, from architecture to deployment, which sharpened how I think about the decisions a team lead has to get right before anyone starts coding.

I'd like to hear more about the role: whether you're recruiting for the client directly or something adjacent, and what the team looks like today. I'm glad to talk about how my background in leadership, architecture and healthcare-adjacent software fits what's needed.

Kind regards,

Nicolás Christie
