AI Adoption Lead — Artificial Intelligence Office · Job Reference 14012

I've spent almost 20 years creating products and tools aimed at making complex systems easier for people to use. My first contact with language models was as early as 2011 when I joined TecnoCientifica, helping develop predictive models for quality control integrations in food industries, but also bringing intuitive UI/UX tools to users with little or no technical background. I developed a strong user-friendly approach to product design, while integrating complex backend systems behind the scenes. It taught me to adapt technical depth depending on the audience, highly technical when the context allows it, simple and clear when necessary.

At Brainlab, I currently work across departments like Finance, Accounting, HR and IT on internal automation and process integration initiatives. Working across multiple departments in a global environment means connecting teams and systems, simplifying workflows, and building tools that collect and present information seamlessly while respecting real governance constraints. I personally developed the company's full expenses integration, from user provisioning to SAP bookings, so employees get the comfort of a 3rd party provider to submit their expenses, accounting teams get relevant information in their SAP systems, and neither has to worry about how data got from one end to the other. A spinoff of this project was a locally-hosted LLM pipeline for CO₂ emissions tracking based on the expenses database, where keeping sensitive financial information entirely on-premise was a core requirement from the start.

Since February 2026 I also embarked on a personal project to develop an autonomous AI-driven website generator, with the simplest possible UI - a chat. Today I already have a near production-ready platform. Built by a single developer during evenings and free time alongside work and family life, in less than 4 months; the project has shown me how dramatically AI can accelerate development when combined with strong technical foundations. Still in PoC stage, you'll find it at platform.appabsolutely.services if you're interested. Based on the premise that non-technical users, small business owners with no technical know-how, should not be left excluded from a world in which a website can make or break a business, my goal is to enable them to keep relevant and up-to-date content, without the ongoing developer costs.

The ECB AI Office and this job opportunity really caught my attention. I use AI extensively both as a personal engineering tool and as part of the solutions I build professionally. I believe my experience places me in a strong position to help organisations adopt AI effectively; I grew professionally before AI became widespread, learned to think without it, research problems thoroughly and work through solutions independently. Today AI accelerates this process, allowing me to ask the right questions while still reasoning through the architecture, tradeoffs and implications of the AI's proposed solutions. The ECB is where I would like to pursue that at scale: a public institution where the stakes of getting adoption right are high, the expert audiences are demanding, and responsible implementation genuinely matters.

I'd be happy to continue this conversation and discuss any aspect of my background further.
