Team Lead AI Engineering – RoboGym

At TecnoCientífica, I built predictive quality models from spectral sensor data, then carried them onto the factory floor myself: installing the devices, validating measurements against lab results, and training the operators who had to run them without me there. Getting a model from a dataset to something a non-specialist trusts day to day is a different problem than getting it to converge, and it's the one I've kept solving since, across embedded systems, enterprise integrations and, more recently, applied AI.

At Brainlab I own cross-department delivery end-to-end, from requirements and stakeholder alignment through vendor coordination to production rollout and support, and I'm the point of contact when a project stalls on a technical problem someone else can't unblock. I coach two apprentices through their technical programme: structuring their work, reviewing their code, giving feedback that holds up under pressure. I also run the company's Power Platform and SharePoint adoption programme, which means building training that gets non-technical colleagues comfortable with tools they didn't choose. Leading a technical team is the direction I've been building toward.

On the technical side, I designed and shipped a CO₂ emissions pipeline that combines OCR with a locally hosted LLM to extract structured data from unstructured receipt text, architecture through production, with no external data exposure anywhere in the loop. Earlier, through the Self-Driving Car Engineer Nanodegree, I worked through CNNs, sensor fusion, SLAM and path planning applied to autonomous systems, on top of the embedded foundation I started with: PIC microcontrollers, CAN and I2C, firmware running against real-time constraints on the factory floor.

NEURA Gym's premise is that robots learn industrial skills fastest from the people who already do them. I hit the same problem installing spectroscopy devices years ago: a model earns trust only once the person running it understands what it's doing. I'd like to bring that combination of hands-on technical grounding and team leadership to RoboGym, and I'm glad to discuss where it fits what you're building.

Kind regards,

Nicolás Christie
