Forward Deployed Engineer · Job ID 5391016008

In February 2026 I set out to build a SaaS platform where AI agents take a natural language prompt and turn it into a deployed, production-ready website. It shipped four months later. Product definition, architecture, infrastructure, deployment: I built all of it solo. That gap between what a model can do and what ships to a user is the same one Forward Deployed Engineers work in every day.

At Brainlab, a global healthcare technology company building software and hardware for cancer and neurological care, I work as technical consultant and implementation lead across Finance, HR, Accounting and IT. Internal teams are treated as clients: I scope requirements, align stakeholders, coordinate vendors and own delivery through to production and ongoing support. One of those projects turned into a fully self-contained AI pipeline, OCR combined with a locally-hosted LLM extracting structured data from receipt text, deployed without any external data exposure so the process stayed secure by design.

I've built integrations across SAP, SharePoint and Salesforce through a custom ESB and third-party APIs, and led enterprise identity provisioning through Azure AD and SSO. Almost twenty years spanning embedded systems, industrial machine learning and enterprise platforms means I'm used to walking into a customer's existing systems, working out what's needed, and building something that holds up inside their constraints rather than around them.

I speak Spanish natively, and German and English fluently at a C2 level, and have worked inside German enterprise environments for the past nine years. Between that and years spent training end users on unfamiliar systems, from lab technicians in Argentina to finance teams in Munich, I'm comfortable being the person on-site turning a model's capability into something a customer's team can run on their own. I'd be glad to discuss how my background fits the FDE team's needs.

Kind regards,

Nicolás Christie
