Corporate Applications, ITS

Basel, Switzerland

Senior IT Product Manager — Corporate Applications · JR100372

I've spent almost 20 years creating products and tools aimed at making complex systems easier for people to use. Whether it was building predictive quality control systems at TecnoCientífica or designing internal automation at a global medical technology company, the constant has been the same: translate technical depth into something that works for the people who actually have to use it. I've learned to adapt depending on the audience, precise and architectural with engineering teams, clear and outcome-focused with business stakeholders, holding both perspectives at once when they need to be reconciled.

At Brainlab, I currently own cross-department initiatives spanning Finance, Accounting, HR and IT. I manage the full product lifecycle end to end: from aligning stakeholders on scope and requirements, through vendor coordination and agile delivery, to production support and continuous improvement. The clearest example is the company's expense management integration: I defined the product strategy, coordinated with the third-party provider, handled user provisioning, and ensured SAP received clean, correctly structured booking data on the other end. Employees submit expenses without knowing the complexity behind the process, and accounting teams don't need to worry about how data gets from one system to another. A later extension of this work was a locally-hosted LLM pipeline for CO₂ emissions tracking, where on-premise data governance was a hard requirement from the start and had to be designed in, not bolted on.

As a technical side project, since February 2026 I have been building an AI-driven website generator from scratch, sole developer, concept to working prototype in under four months, managing the product roadmap, infrastructure decisions, and user experience entirely independently. It has shown me how much you can compress delivery timelines when you combine strong technical foundations with modern AI tooling, and how quickly architectural decisions that seem minor early on become expensive to reverse later.

In my experience, the technology is rarely where things get hard. What takes the most effort is getting people with different priorities and timelines to agree on what done actually looks like. Working across Finance, HR, Accounting and IT at Brainlab has given me a lot of practice at that, and I've found that having a technical background helps: I can have a detailed architecture conversation in the morning and a budget discussion with a business owner in the afternoon without losing the thread between the two. The BIS role appeals to me because Corporate Applications has to hold all of those dimensions at once, strategic direction, vendor relationships and day-to-day operational reliability, and the systems that underpin an institution like the BIS need to be genuinely dependable. That combination of scope and consequence is what I find interesting, and where I think I can contribute.

I'd be happy to continue this conversation and discuss any aspect of my background further.

Kind regards,
