AI Adoption · AI Adoption Manager · Software engineering

A CO₂ estimation tool built from expense receipts: a self-hosted LLM reading unstructured text so no data leaves the building. That is the kind of AI project I gravitate toward, solving one team's real problem rather than applying AI everywhere at once. At Brainlab, I do the discovery, prototyping and enablement work your AI Adoption Manager role describes, just without the title.

Cross-department discovery is a big part of my day-to-day: sitting with Finance, HR, Accounting and IT to find what is actually slowing them down, then scoping and delivering the fix end to end. I administer Langdock, our company AI assistant platform, managing user access, curating a shared prompt and use-case library, and running onboarding sessions. I also lead Power Platform and SharePoint adoption for the organisation, running training sessions for non-technical colleagues and coaching two apprentices through their technical development. Turning a tool into something a department actually uses, day after day, is the part of the job I enjoy most.

On the technical side, I have built integrations across SAP, SharePoint and Salesforce, and managed enterprise identity through Azure AD and SSO. Since February 2026 I have also been building my own AI-powered SaaS platform outside of work, from product definition through to a deployed, working product. That project keeps me hands-on with LLM agents and prototyping tools, and it is also where I learned to say no to AI: some workflows are faster and more reliable as a few lines of deterministic code, and knowing which is which saves both budget and trust. Fluent in German and English, and used to acting as the bridge between technical delivery and non-technical stakeholders.

I'd welcome the chance to talk about where this experience fits your AI Champions network and the departments you're working with.

Kind regards,

Nicolás Christie
