

BBVA

Munich, 23 July 2026

Madrid, Spain

Full-Stack Developer (Individual Contributor)

Almost 20 years building software end to end, from embedded firmware and machine-learning models at food processing plants in Argentina, through high-volume logistics platforms at Euro-Log, to enterprise integrations and internal applications at Brainlab. Frontend, backend and the databases underneath have all been part of the work. I'm Argentine and German, native in Spanish, fluent in English and German, and currently based in Munich.

At Brainlab I own cross-department projects end to end: requirements and stakeholder alignment, architecture, development, production rollout and ongoing support. On the build side that means REST integrations across SAP, SharePoint and Salesforce through a custom C# service bus, workflow automation on Azure and the Power Platform, and enterprise identity and provisioning through Azure AD and SSO. One project processes the company's full expense management into SAP; on top of that dataset I built a CO₂ estimation tool with an OCR pipeline and a locally hosted LLM, kept self-contained so no data left our environment. I also coach two apprentices through their technical training, mostly by example.

Since February 2026 I've been building my own SaaS platform in my free time. Sole developer, concept to a working product in under four months: React on the front, Node and Python on the back, PostgreSQL underneath, CI/CD, deployed and running. It generates and deploys production websites from natural-language prompts, so I've been across the whole stack, from the database to the browser, plus the AI layer on top.

BBVA's scale and the engineering bar in the description are what draw me: secure-by-design, tested, observable software taken all the way to production. I'd be glad to discuss how my background fits what the team needs.

Kind regards,

Nicolás Christie
