

LGT

Munich, 9 July 2026

Zurich, Switzerland

Forward Deployed Engineer (f/m/d) · Ref. 359892

When Finance needed a carbon figure for every travel expense, the data sat in thousands of unstructured receipts, and none of it could leave the building. I built an OCR pipeline paired with a locally hosted LLM (Ollama) that reads each receipt, extracts the structured fields and books the result, running entirely inside our network with no external data exposure. An AI solution that solves a real business problem while respecting a regulated environment's constraints is close to the work this role describes.

At Brainlab I own cross-department initiatives end to end. Finance, HR, Accounting and IT are my internal clients: I sit with them to understand the workflow, scope where technology is worth building, then carry it from architecture through production rollout and continued support. Much of the job is translation, turning a team's pain point into something buildable and explaining the result back so they can trust and run it themselves. I also lead our Power Platform and SharePoint adoption programme, designing training that leaves non-technical colleagues working on their own.

On the AI side, since early 2026 I have been building a SaaS platform in my own time that uses LLMs and AI agents to generate and deploy production websites from a natural language prompt. Sole developer from concept to working product: LLM integration, tool use, context orchestration and the guardrails that keep agent output dependable. It has shown me where agentic workflows create value and where they still need a human in the loop, which counts for more inside a bank, not less.

Almost twenty years across embedded systems, enterprise platforms and AI have pointed the same direction: making complicated technology usable for the people who depend on it. I work fluently in German and English. LGT's aim of turning AI potential into measurable value inside Private Banking's constraints is the problem I want to work on, and I'd welcome the chance to talk it through.

Kind regards,

Nicolás Christie
