Senior Solution Expert & Team Lead · #2575177

At TecnoCientífica, my job was to get food processing plant operators to trust a device that replaced their lab. The technology worked; getting people to change how they worked took longer. I sat with lab staff and in-plant teams, worked through their questions and edge cases, and stayed until they could run things on their own. That pattern has repeated at every job since, just with different technology and different people.

At Brainlab I own cross-department integrations spanning Finance, HR, Accounting and IT, from scoping and stakeholder alignment through delivery and production support. Rolling something out means designing how colleagues learn to use it, running the training sessions, and making sure they don't go back to the old way three weeks later. I lead two apprentices through their technical programme: setting the work, giving structured feedback, managing their development over time. The team lead function in this role is work I recognise.

On the technical side, I've built integrations across SAP, SharePoint, Salesforce and third-party providers through custom middleware and REST APIs, managed enterprise identity through Azure AD and SSO, and handled multi-platform escalations that need a full-stack view to diagnose. Since February 2026, I've been building AppSolutely, a SaaS platform that generates and deploys websites from natural language prompts, sole developer from concept to working product in under four months. Building something with real users at the other end teaches things internal projects don't.

Helping enterprises close the gap between software investment and software use is a concrete problem. I'd be glad to talk through how this fits what the Solutions team needs.

Kind regards,

Nicolás Christie
