

Userlane GmbH

Munich, 17 June 2026

Munich, Germany

Senior Solution Expert & Team Lead · #2575177

I've spent almost 20 years making complex technology usable for the people who actually have to work with it. That thread runs from predictive quality control systems deployed at food processing plants in Argentina — trained on the operators who ran them — through internal tooling and integrations at a global medical technology company, where Finance, HR and IT teams have been my effective clients all along. The idea behind a Digital Adoption Platform is one I've been practising without the product label: you don't ship technology, you ship capability. When I read what Userlane does, it maps directly to what I've found matters most.

At Brainlab I currently own cross-department initiatives end-to-end: from requirements and stakeholder alignment through vendor coordination, agile delivery, production rollout and continued support. Alongside that, I lead the company's Power Platform and SharePoint adoption programme — designing and delivering training sessions for non-technical colleagues, building the kind of capability that doesn't collapse the moment I step back. I also directly lead two apprentices through their technical development: setting expectations, giving structured feedback, and making sure they grow into confident independent contributors. The team lead function at Userlane — two Solution Experts, coaching and performance management — maps closely to what I'm already doing. The difference is that those people would be external customers instead of internal colleagues, which is a direction I'm deliberately moving toward.

On the technical side: I've built integrations across SAP, SharePoint, Salesforce and third-party providers via REST API, deployed enterprise identity and provisioning through Azure AD and SSO, and escalation-handled the kind of cross-system issues that require understanding multiple platforms at once. Since February 2026, I've also been building my own SaaS platform — sole developer, concept to working product in under four months. That experience on the vendor/product side has sharpened how I think about implementation quality, customer impact and what goes wrong when architectural decisions get made too late.

I'm drawn to this role because the mission is concrete: help enterprises actually use the software they've invested in. That's a problem worth solving. I'd be glad to discuss how my background fits what the Solutions team needs.

Kind regards,

Nicolás Christie
